

Pest Control System

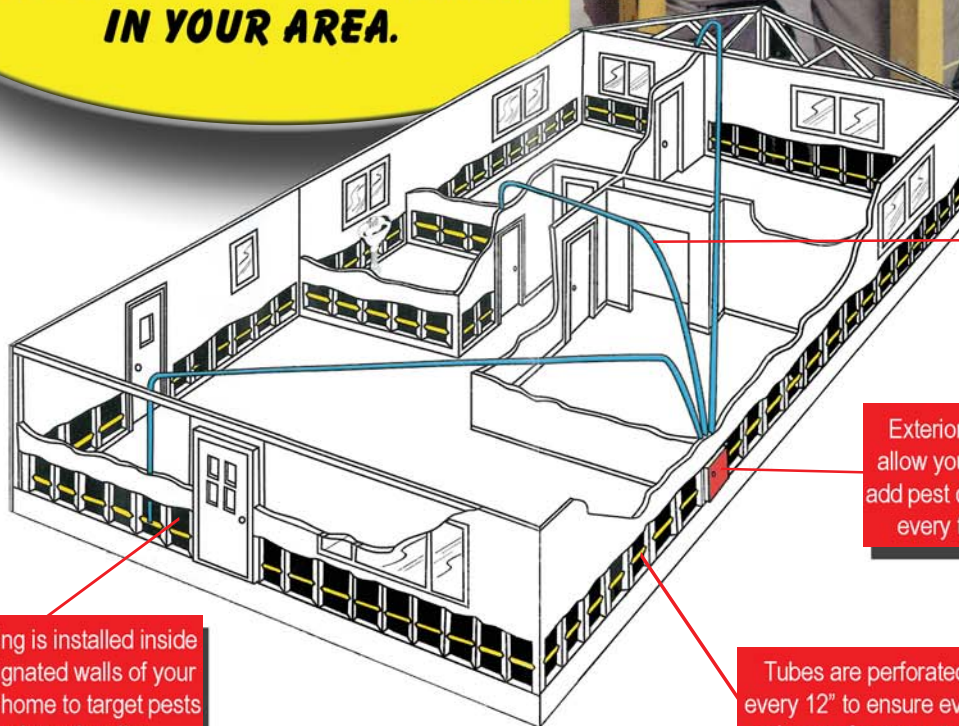

The Pest Defense System, Tubes in the Wall pest control system is an innovative and effective way to safely target household pests where they live - inside the walls of your home.

Installed during construction, the Pest Defense System is a network of small plastic tubing installed in designated walls. The tubes are perforated at regular intervals and are linked to service ports on the exterior of your home.

Service ports are conveniently located on the outside of your home. This allows your Centex Home Team Pest Control technician to inject precise amounts of pest control materials into the tubes every three months. The fine mist travels through the tube network, targeting household pest where they live.
